“HazCat® Chemical Identification Systems do the chemistry for you”

Radiological • Explosive • Chemical Weapons • Biological

HazTech Systems, Inc., the leader in field identification of unknown substances, is proud to present our product, the KT1235 Weapons of Mass Destruction Detection System. This system brings for the first time to the professional first responder, a highly portable, small and lightweight field detection system with accurate, easy to use tests that yield conclusive results.

The KT1235 is a comprehensive WMD detection and classification system complete with a radiological meter, SampleCat® evidence collection tools, evidence retention labels and transport bags, chemical testing reagents, and biological agent testing supplies including hand-held immunoassay strips. Tests detect radiation, explosives, all 31 treaty-banned chemical weapons and their precursors, and biological threats. The KT1235 includes an Inventory Supply Kit with sufficient supplies to accommodate ten incidents and a complete field operating manual. The entire system is securely packed in two Pelican cases.

HazCat® test procedures are simple to follow and easily performed by non-chemists. The manual clearly directs the user through appropriate testing procedures with straightforward step-by-step instructions. Only approximate amounts of the unknown and reagents are necessary to obtain accurate results, with no math required. Using the unique HazCat® decision matrix algorithm, reagents, and tools, a skilled user can completely screen an unknown, while in the field, for any known WMD potential in as little as 25 minutes.
